

ABSTRACT

TRANSMISSION OF INFORMATION BY SUBSCRIBER TERMINAL WITH RESPECT TO RECEPTION OF DATA BLOCK IN POINT-TO-MULTIPOINT RADIO TRANSMISSION SYSTEM.

When at least one data block is transmitted from a base station to subscriber terminals according to a point-to-multipoint transmission, a request on the signalling of information with respect to the respective reception of the data block to a selected group from the receiving subscriber terminals is transmitted by the base station. At least one subsequent transmission of a data block is initiated by the base station according to information received from the selected group of subscriber terminals.
